

SpeciCare Introduces You To Options That Never Existed Previously

Collect, test and preserve your living tumor tissue and change the outcome.

There is no "one size fits all" cancer treatment. Some patients receive surgery, while others undergo radiation. Many receive chemotherapy, hormone therapy or immuno-oncology (IO) therapies. One thing is certain - each path takes its toll. By preserving living tumor tissue from surgery or biopsy with SpeciCare, you can unlock hundreds of options for your fight against cancer.

Test More Than 300 Drugs

When you send living tumor tissue to SpeciCare, we can grow the tissue in a laboratory setting and test it against as many as 300 known cancer drugs, to provide individualized data on the courses of treatment that perform most effectively.

Clinical Trial of One

Partnering with SpeciCare is like having an individualized clinical trial tailored to you, with results returned in as little as a few weeks. Every cancer reacts differently, so we test the full battery of treatment options to learn which works best for you.

Go Beyond the Standard for Care

In some cases, the most effective treatments might have never been considered. For one SpeciCare client, Elissa, a breast cancer drug proved most effective in treating her stage four colorectal cancer. Visit specicare.com/Elissa for her story.

Store for Future Use

For many patients, the full battery of tests might be unnecessary, or impossible at the moment. But, by storing the tissue with SpeciCare, you can rest assured knowing that scientific data about your cancer, and the possibility for future testing are just one call away.

The Tumor Travels, Not the Patient

In today's travel restricted environment, the fight against cancer doesn't have to be put on hold. With SpeciCare, only tumor tissues need to reach our labs for results to be attainable.
